Obesity is a complex, chronic condition characterized by excessive accumulation of adipose tissue, measured by a body mass index (BMI) of 30 or greater. Living with obesity, particularly in the context of rapid urbanization and increased consumption of processed foods, has led to a significant rise in non-communicable diseases (NCDs) such as type 2 diabetes, cardiovascular disease, and certain cancers. In India, the prevalence of obesity has increased significantly, with a notable rise in women and children.
